ORBIT · PRODUCTION, PURCHASE AND QUALITY

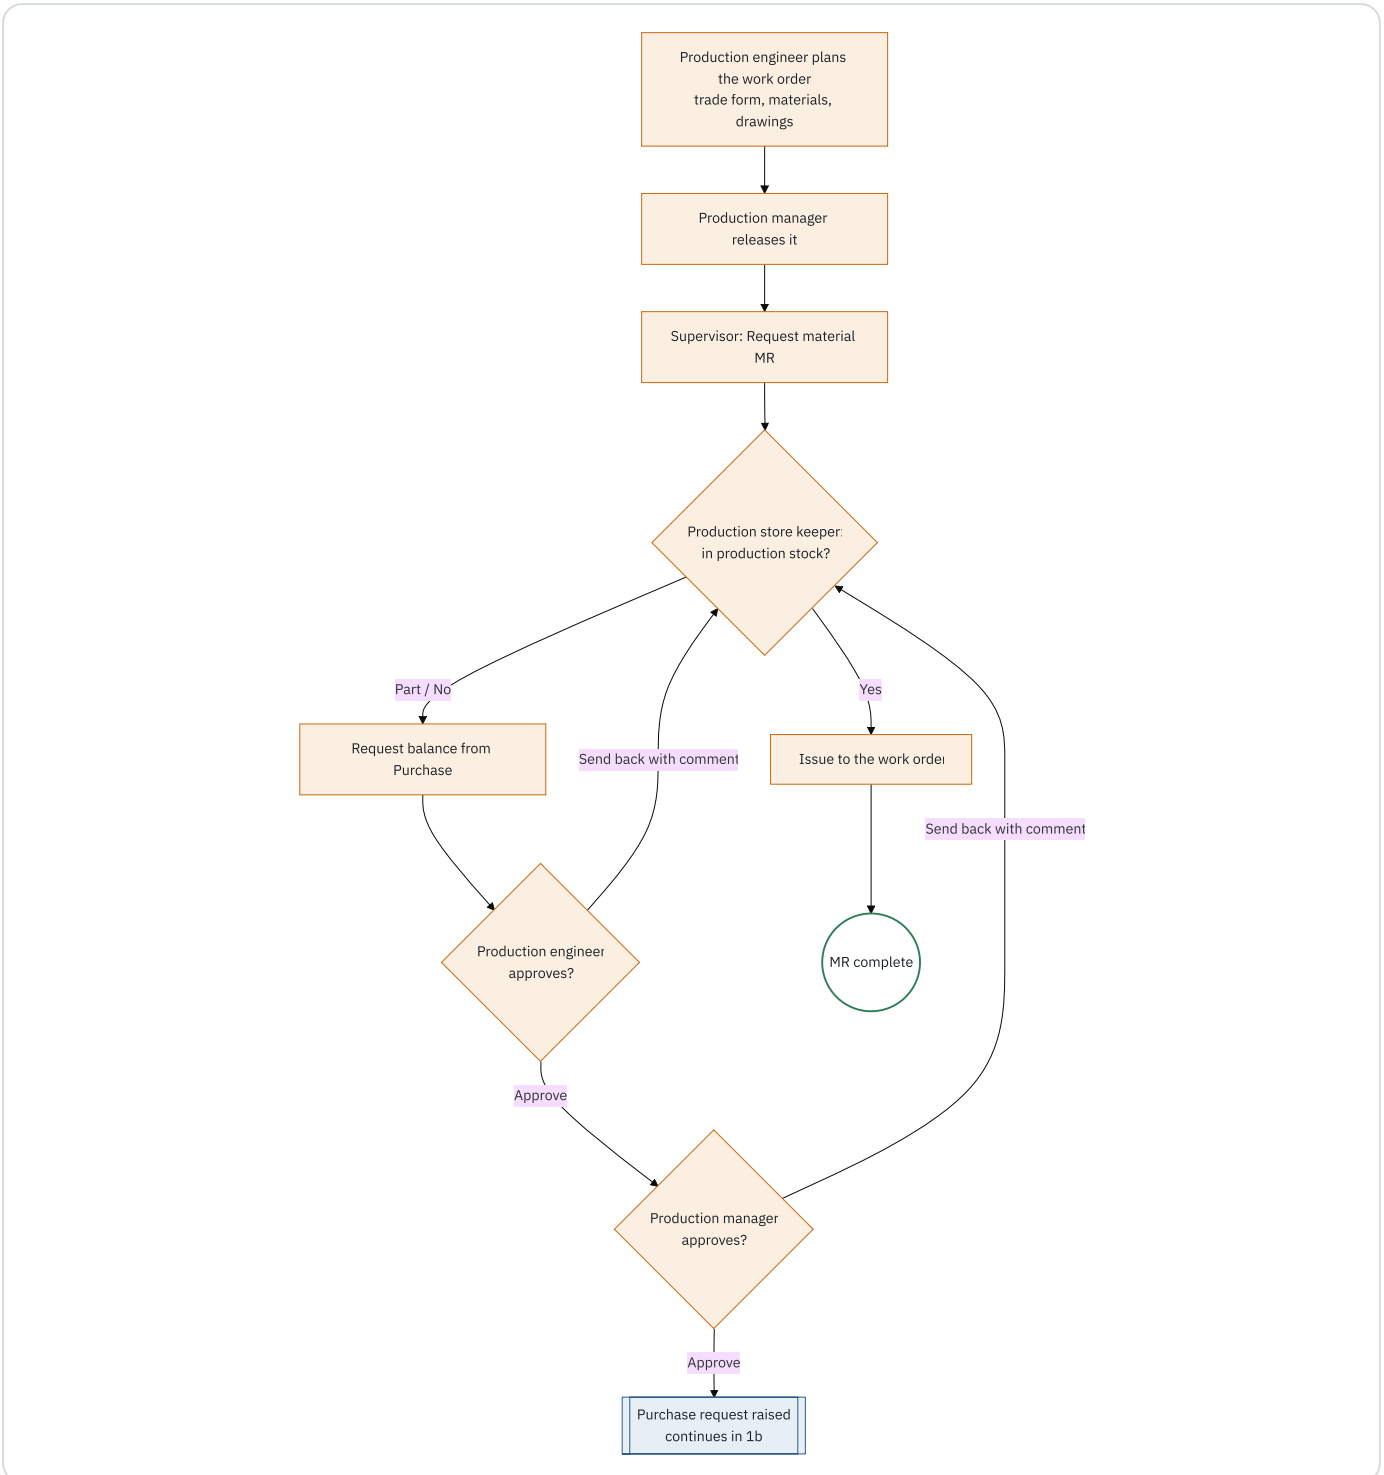

Material flow with approvals

How material moves from a work order to the shop floor: who asks, who approves, where it comes from (production stock, the main store or a supplier) and where QC checks it. The GM can stop any step.

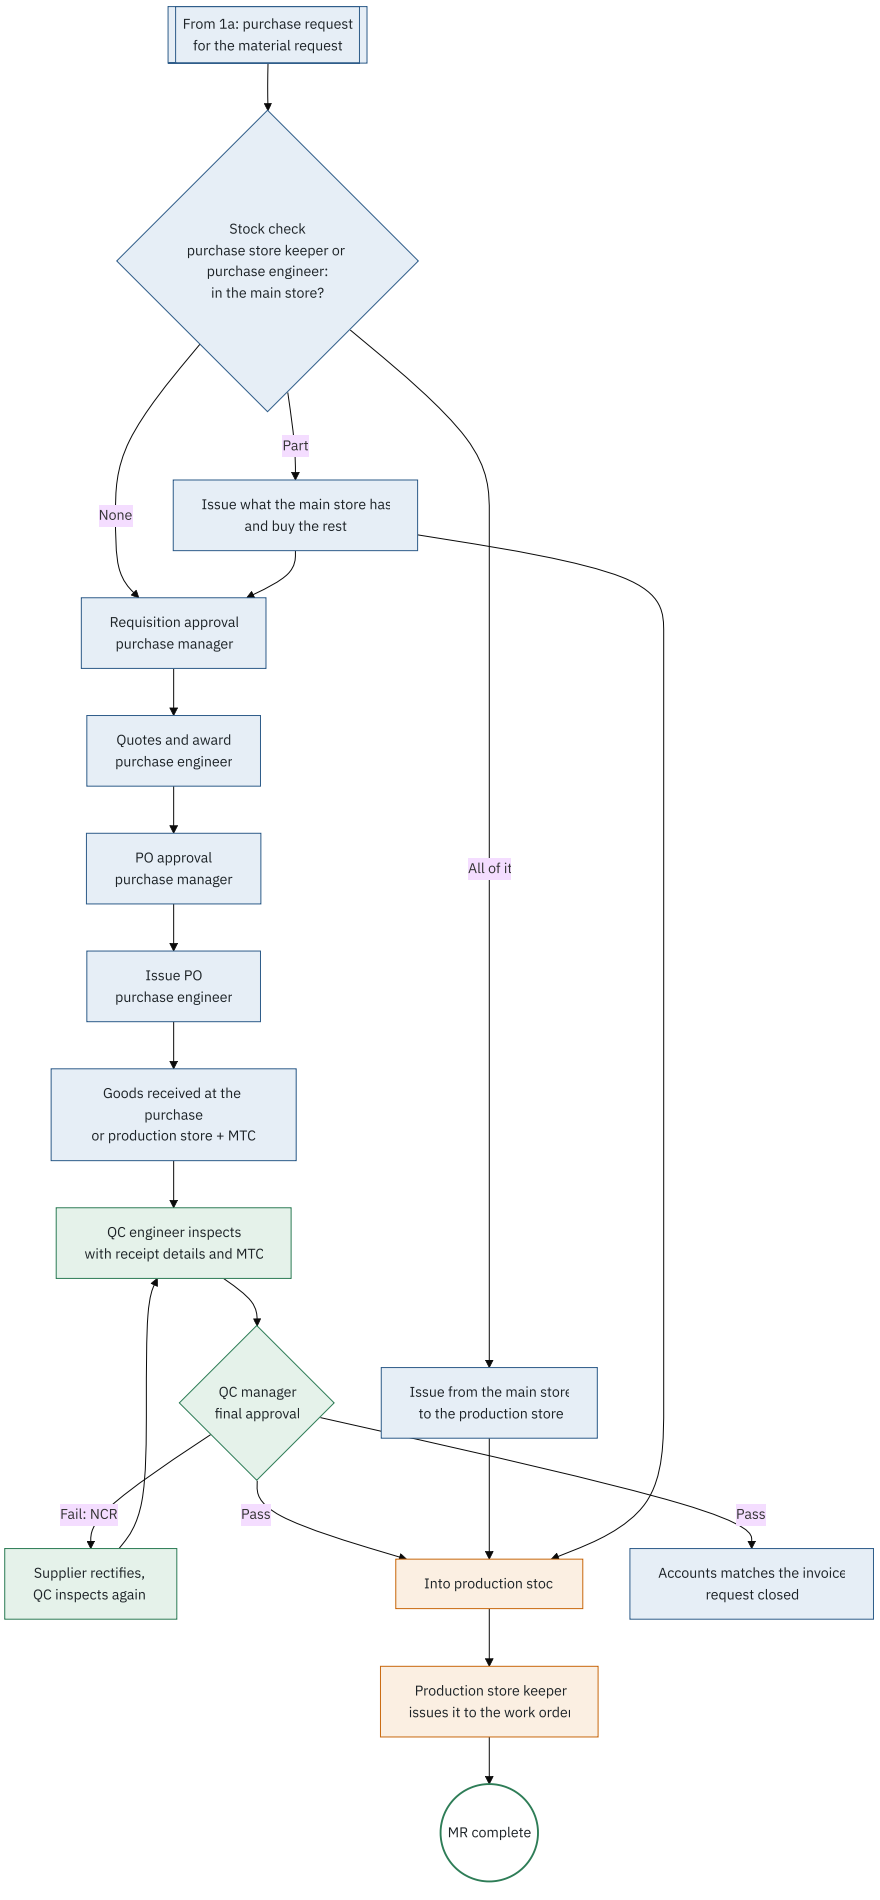

Production | Purchase | Quality (QC) | GM stop

1. Work order to material on the shop floor

1a. Production: work order and material request

1b. Purchase and QC, back to the work order

Steps by portal

PRODUCTION

1. The **production engineer** plans the work order; the **production manager** releases it.
2. The **supervisor** clicks *Request material* on the work order.
3. The **production store keeper** issues what production stock has. For the rest: *Request balance from Purchase*.
4. **Production engineer**, then **production manager** approve. Either can send it back to the store with a comment.

PURCHASE

1. The **purchase store keeper** or **purchase engineer** checks the main store and issues what it has to the production store.
2. What is not in stock: **purchase manager** approves the requisition, the **purchase engineer** collects quotes, the **purchase manager** approves the PO, the purchase engineer issues it.
3. The store records the delivery: *received at* the purchase store or the production store, with the **MTC** uploaded.

QUALITY

1. The **QC engineer** inspects with the delivery details and the MTC, and marks each check OK / Not OK.
2. The **QC manager** gives final approval. Pass: material goes into production stock. Fail: NCR, the supplier rectifies, QC inspects again.
3. The production store keeper then issues it to the work order. **Accounts** matches the invoice in Purchase.

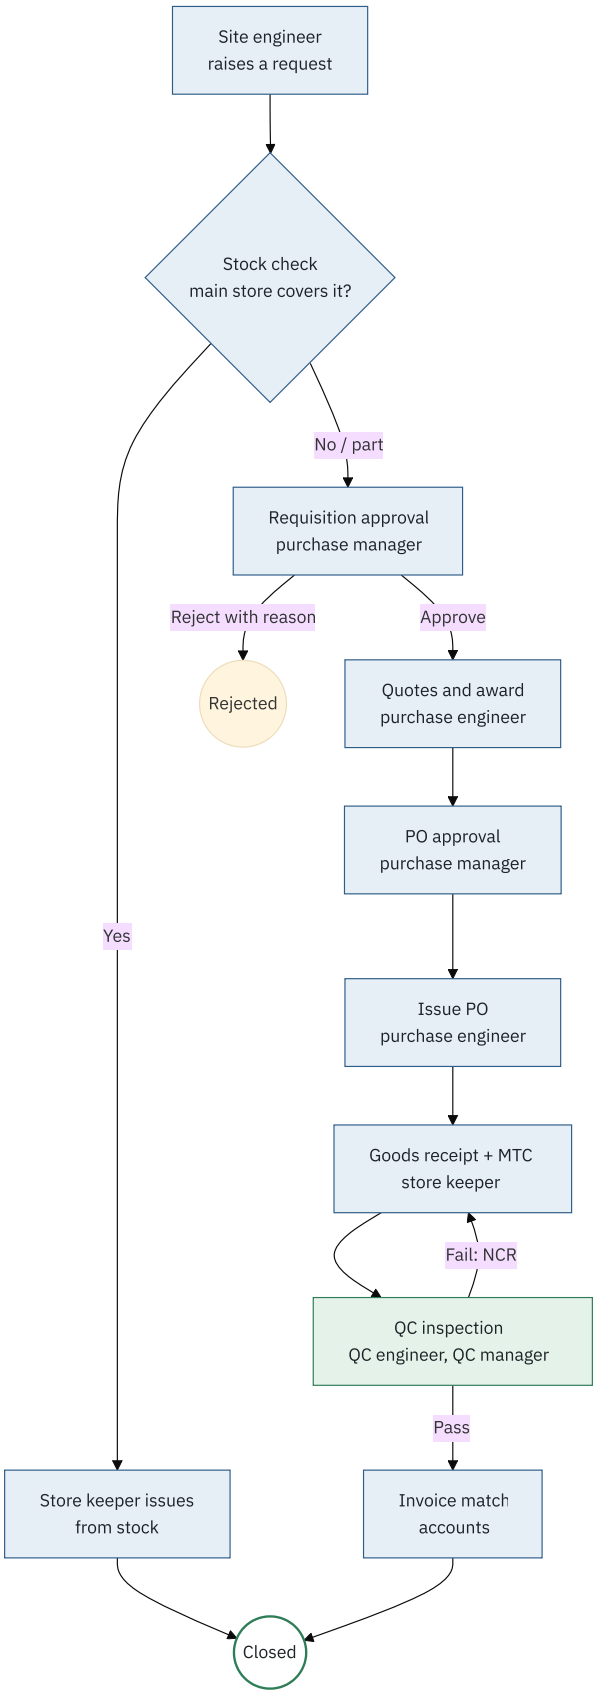

GM: view, stop and comment

The GM does not approve. The managers' approvals are final. The GM sees every record in every portal and can **Stop** it with a reason at any step, also after a manager has approved, then **Resume** it with a note.

A stop follows the work: stopping a work order also stops its material requests, the purchase raised for them and the QC inspection. Those pages show who stopped it and why, and nothing moves on until the GM resumes the record that was stopped. Everything on hold is listed under *Management → Process control*.

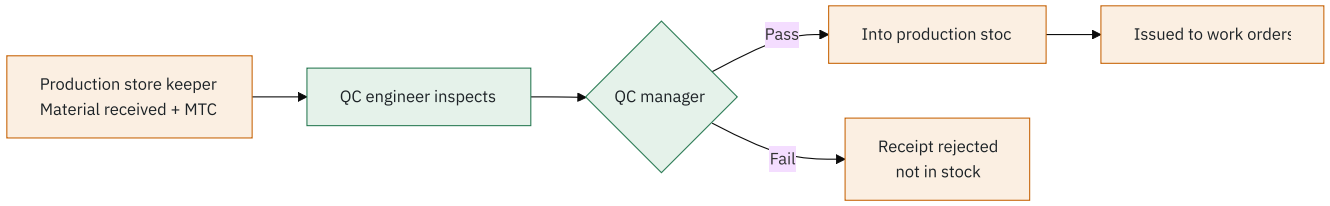

2. Purchase request with approvals

A request from site (or from Production, as above). Stages can be switched on or off in Purchase workflow settings; approvals stop at the purchase manager.

3. Direct delivery to the shop floor

Material that arrives at the production store without a purchase request (for example a local supplier).

Who does what

ROLE	PORTAL	DOES
Production engineer	Production	Plans work orders; first approval of a material request going to Purchase
Production manager	Production	Releases work orders; final production approval, sends the request to Purchase
Supervisor	Production	Receives released work orders, requests material, reports daily output
Production store keeper	Production	Production stock: issues, asks Purchase for the balance, records deliveries with MTC, dispatches
Purchase store keeper	Purchase	Main store: stock check, issues from stock, goods receipt with MTC
Purchase engineer	Purchase	Stock check, quotes, award, issues the PO
Purchase manager	Purchase	Approves the requisition and the PO (final)
QC engineer / QC manager	Quality	Inspection with MTC; final approval, pass or NCR
Accounts	Purchase	Matches the supplier invoice to PO and receipt
GM	All	Views everything; stops, resumes and comments. No approvals
